

8. Project Demonstration Phase

ComicCraft – AI Comic Story Creator Using Gemini Models

Presenting the complete ComicCraft workflow to an audience

1. Demonstration Objective

The demonstration presents how a user turns a simple idea into a personalized comic using the ComicCraft web interface and its AI generation pipeline.

2. Preparation

Before the demonstration, install the required dependencies, configure the Gemini API key and Hugging Face token, and start the FastAPI application with Uvicorn. Open the homepage and ensure the local application is accessible.

3. Introduction

Introduce ComicCraft as a web-based AI comic story creator that combines Gemini models for story content and Stable Diffusion for illustrations. Explain that users can preview and download the generated comic as a PDF.

4. Step 1 – Enter a Story Idea

On the homepage, enter a sample prompt such as “A brave fox exploring an enchanted forest.” Provide a character name and select a setting, tone, and art style.

5. Step 2 – Generate the Comic

Submit the form. Explain the workflow: Gemini Flash creates a structured five-panel outline; Gemini Pro expands it into narration and dialogue; Stable Diffusion creates an illustration for each panel; the backend assembles the results.

6. Step 3 – Review the Preview

Show the comic preview page. Walk through the panels in order and point out the panel title, illustration, scene description, caption, and narration.

7. Step 4 – Download the PDF

Select “Download Your Comic as PDF.” Explain that the export process uses the layout and PDF exporter to place panel images and story text into a multi-page PDF.

8. Step 5 – Show Export Confirmation

Show the export-success page and its confirmation message. Point out the “Go Create Another Comic” action for returning to the homepage.

9. Optional Technical Demonstration

For a developer-focused presentation, open /docs and show the available API routes. The /generate-comic/json route demonstrates JSON-based generation, while /test-image allows image generation to be tested separately.

10. Closing Summary

Conclude by recapping the end-to-end workflow: user prompt, structured outline, narration and dialogue, panel illustrations, preview, and PDF export. The demonstration should show the actual running application and avoid claiming features or test results that have not been verified.
